

DZee Solutions is an innovative analytics and decision support software company for Benefit Advisors to evaluate Healthcare Benefit plans. DZee provides an integrated suite of decision support engines that simplify and automate benefits plan analysis, cost projections, and selection decisions. DZee utilizes “All-Payer” claims data banks, machine-learning methods, and healthcare tuned algorithms to scientifically determine/predict:

- (1) The optimal types, mix and number of healthcare plans to be included in a company’s program
- (2) The optimal bundling of healthcare & supplemental benefits plans into tailored packages
- (3) The costs and risks of self-funding health insurance plans, plus guidance for setting stop-loss levels
- (4) On-demand cost projections for short, mid, and long-term time periods based on real expenses
- (5) The ROI of wellness program investments resulting from changes in health profiles & conditions

Past claims data is an imperfect predictor of future costs. Claim experiences, when combined with clinical results, family history, and lifestyle are a more accurate predictor of future healthcare costs. DZee’s analytics engines can predict a person’s benefits consumption over their full lifetime.

DZee’s platform supports a full-year Benefit Life-cycle Management.

With DZee you can conduct virtual “what if?” simulations using actual participant census and claims data in advance of open enrollment to reveal the most likely outcomes and costs that will be experienced.

DZee’s cloud-enabled analytics platform typically saves 15% or more of first-year healthcare costs!
